

## CHARACTERISTICS

- Technology suitable for all types of mail: envelopes, magazines, plastic wrappings, open items, etc.
- Just one flow of mail, a centralised sorting process for letters and flat objects
- Time spent by the postman in the distribution centre is reduced to a minimum
- Constraints concerning both logistics and operator comfort taken into account
- Rapid installation in just 2 weeks by our teams
- Overall footprint lower than when using separate solutions for each type of mail
- A unique mail flow and reduction of manual merging

## IN BRIEF

Today postal operators are facing up to new challenges: the consequences of the financial crisis and the growing use of Internet, significant reductions in volumes, particularly in first class mail. At the same time, for each delivery round the number of distribution points is increasing even though the number of letters is going down. In an already highly competitive market, operators are striving for greater competitiveness and, to this end, call for reductions in operating costs.

## BENEFITS

- Delivery rounds prepared automatically for 90% of postal items, letters and flat objects
- Operating costs reduced by two-thirds for merge processing of letters and flat objects
- A new solution which all postal operators can implement easily
- A choice which meets future requirements whatever the ratio of letters to flat objects
- A unique investment with a strong impact on associated costs:
  - just one type of equipment,
  - a smaller footprint,
  - a reduced stock of spare parts,
  - a reduction in training and maintenance costs.
